

Scenario: You recently went to a friend's house and hung out with their roommates without a mask and now you want to visit an older relative. You have just downloaded the "Covid-19 Testing App", in the hopes of finding an available Covid-19 testing appointment since the app is said to be more efficient than trying to find your own appointment by yourself.

Tasks:

1. Figure out how to access your account.
2. Create an appointment at your desired location, for Nov 1st at 2pm.
3. After creating an appointment, figure out how to return to the home screen.

Things to Fix:

1. It was observed in my design I should make the menu button more user friendly (label it home)
2. It was observed in my design that users did not know if they had successfully made an appointment when scheduling. However, I think we could add a feature to make it so it sends a notification that you made an appointment to your logged in email.

Things to Keep:

1. Keep the Home Screen layout, it is pretty user friendly.
2. Keep the schedule meeting function the same format.
